Airbus A320 Series Electrical System. Electrical System Presentation. There are two identical engine driven generators called Integrated Drive Generators (IDG). They are used as the main power source to supply the A/C electrical network. The IDG basically contains, in a common housing, a generator and a Constant Speed Drive (CSD).

The Airbus A320 is the first example of a second generation of civil electrical flight control aircraft which includes the A340 (certified at end of 1992). The distinctive feature of these aircraft is that all control surfaces are controlled electrically by high-level control laws in normal operation and that the system is designed

The Airbus A320 family consists of short- to medium-range, narrow-body, commercial passenger jet airliners manufactured by Airbus. The family includes the A318, A319, A320 and A321, and the ACJ business jet. The aircraft family can accommodate up to 220 passengers and has a range of 3,100 to 12,000 km (1,700 to 6,500 nmi), depending on model.

electrical power system. The oil-cooled HMDG produces 5KVA (Power Factor 1.0 - 0.75 lagging) of electrical power from the Blue system RAT pump. The Airbus A320 family of aircraft engines are also equipped with Eaton's Tedeco ® chip collectors, located in the secondary power system oil flow. The collectors capture ferrous wear particles

An all-electric Airbus A320 would be a wonderful thing. Why? Fasten your seatbelts as we're about to encounter some very rough maths. On an average flight, Ryanair emits of around 66g of CO2 per passenger per km. There are 189 seats on a Boeing 737, and Ryanair's January load factor was 91%. This would mean there were approximately 172 ...

EGTS technology enables aircraft to avoid using their main engines during taxiing and instead taxi autonomously under their own electrical power, using the Auxiliary Power Unit (APU) generator. The system is designed for single-aisle aircraft, such as the Airbus A320 and the Boeing 737
