Modern Biology Study Guide Answer Key Section 7-1 VOCABULARY REVIEW 1. Cellular respiration is the process in which cells make ATP by breaking down organic compounds. 2. Glycolysis is a biochemical pathway in which one molecule of glucose is oxidized to two molecules of pyruvic acid. 3. Lactic acid fermentation is an anaerobic pathway

through the anaerobic processes of glycolysis and fermentation. Fermentation does not make ATP, but it allows glycolysis to continue. Remember that the products of glycolysis are pyruvate, ATP, and NADH. In the process of glycolysis, NAD<sup>+</sup> is turned into NADH.

**VOCABULARY REVIEW Define the following terms.**

This section explains what cellular respiration is. It also describes what happens during a process called glycolysis and describes two types of a process called fermentation. Chemical Energy and Food (page 221) 1. What is a calorie? It is the amount of energy needed to raise the temperature of 1 gram of water 1 Celsius degree. 2.

Because glycolysis does not require oxygen, the process is considered to be anaerobic. For certain anaerobic organisms, such as some bacteria and fermentation yeasts, glycolysis is the sole source of energy. Glycolysis is a somewhat inefficient process because much of the cellular energy remains in the two molecules of pyruvic acid that are ...
